**Specificity** **Rabbit anti HDAC5 antibody** recognizes a histone which plays a critical role in transcriptional regulation, cell cycle progression, and developmental events. Histone acetylation/deacetylation alters chromosome structure and affects transcription factor access to DNA. The protein encoded by HDAC5 belongs to the class II histone deacetylase/acuc/apha family. It possesses histone deacetylase activity and represses transcription when tethered to a promoter. It coimmunoprecipitates only with HDAC3 family members and might form multi-complex proteins. It also interacts with myocyte enhancer factor-2 (MEF2) proteins, resulting in repression of MEF2-dependent genes. HDAC5 is thought to be associated with colon cancer. Two transcript variants encoding different isoforms have been found for HDAC5 (provided by RefSeq, Jul 2008).

**Western Blotting** Rabbit anti histone deacetylase 5 antibody recognizes a band of approximately 124 kDa in Jurkat cell lysate
