

## Datasheet: LNK023RPE BATCH NUMBER 151954

Description:	LYNX RAPID RPE	ANTIBO	DY CON.	JUGATION KIT				
Name:	RPE CONJUGATI	ON KIT						
Format:	Kit							
Product Type:	Conjugation Kit	Conjugation Kit						
Quantity:	1 CONJUGATION	/						
Product Details								
Applications	This product has been re derived from testing with communications from the information. For general <u>rad-antibodies.com/proto</u>	in our labo originato protocol re <u>cols</u> .	oratories, ors. 	Conjugation	Yes	No	Not Determined	Suggested Dilution			
	protein. Activation of proprietary reagents within the antibody-label solution results in directional covalent bonding of RPE to the antibody. The LYNX Rapid Conjugation kit® can be used to label small quantities of							
	antibody/protein at near neutral pH, allowing a high conjugation efficiency with 100% antibody recovery.							
Reagents In The Kit	1 Vial of 1mg LYNX lyophilized RPE mix 1 Vial LYNX Modifier reagent 1 Vial LYNX Quencher reagent							
Preparing The Antibody	The following buffer solutions are recommended for preparing the antibody:							
	10-50mM amine-free buffer (e.g HEPES, MES, MOPS and phosphate) pH range 6.5-8.5, although moderate concentrations of Tris buffer (<20mM) may be tolerated.							
	If possible, avoid buffe amines and thiols (e.g.		-	• •				

	<b>chemicals</b> . Azide (0.02-0.1%), EDTA, up to 50% Glycerol and common non-buffering salts and sugars have little or no effect on conjugation efficiency.
	Due to the large size of RPE (240kDa), it is recommended that 50-60ug of antibody be used for every 100ug RPE, to ensure a slight RPE molar excess. For optimal results the antibody should be at a concentration of 1mg/ml, with a maximum volume of 600ul and a maximum antibody amount of 600ug. Antibody at a concentration of greater than 1mg/ml requires dilution. Antibody below 1mg/ml can still be used as long as the maximum volume is not exceeded. Using less than the recommended amount of antibody may result in unbound label, but this will be removed during subsequent application wash steps. Antibody below 0.5mg/ml should be concentrated before use with the kit.
Instructions For Use	1. To the antibody sample add 1ul of the Modifier reagent for every 10ul of antibody and mix gently.
	2. Pipette the mixed antibody-modifier sample directly onto the LYNX lyophilized mix and gently pipette up and down twice to resuspend.
	3. Replace cap onto vial and incubate in the dark at room temperature (20-25 <sup>o</sup> C) for 3 hours, or overnight if preferred.
	4. After incubation, add 1ul of Quencher reagent for every 10ul of antibody used. Leave to stand for 30 minutes before use.
