

## Datasheet: MCA5977

<b>Description:</b>	MOUSE ANTI INFECTIOUS SALMON ANEMIA VIRUS (ISAV)
<b>Specificity:</b>	Infectious Salmon Anemia Virus (ISAV)
<b>Other names:</b>	INFECTIOUS SALMON ANEMIA VIRUS
<b>Format:</b>	Con S/N
<b>Product Type:</b>	Monoclonal Antibody
<b>Clone:</b>	4A11
<b>Isotype:</b>	IgG1
<b>Quantity:</b>	0.5 ml

## Product Details

### Applications

This product has been reported to work in the following applications. This information is derived from testing within our laboratories, peer-reviewed publications or personal communications from the originators. Please refer to references indicated for further information. For general protocol recommendations, please visit [www.bio-rad-antibodies.com/protocols](http://www.bio-rad-antibodies.com/protocols).

	Yes	No	Not Determined	Suggested Dilution
Flow Cytometry			▪	
Immunohistology - Frozen	▪			
Immunohistology - Paraffin			▪	
ELISA	▪			
Immunoprecipitation			▪	
Western Blotting			▪	
Immunofluorescence	▪			

Where this product has not been tested for use in a particular technique this does not necessarily exclude its use in such procedures. Suggested working dilutions are given as a guide only. It is recommended that the user titrates the product for use in their own system using appropriate negative/positive controls.

<b>Target Species</b>	Viral
<b>Product Form</b>	Tissue Culture Supernatant - liquid (concentrated)
<b>Preservative Stabilisers</b>	0.09% Sodium Azide (NaN <sub>3</sub> )
<b>Approx. Protein Concentrations</b>	IgG concentration 0.5 - 1.0 mg/ml
<b>Immunogen</b>	ISAV isolate

---

**Fusion Partners** Spleen cells from immunised Balb/c mice were fused with cells of the Mouse SP2/0-Ag-14 myeloma cell line.

---

**Specificity** **Mouse anti Infectious Salmon Anemia Virus, clone 4A11**, specifically recognizes the Infectious Salmon Anemia Virus, an orthomyxovirus being the sole member of the *Isavirus* genus. ISAV is the causative agent for Infectious Salmon Anemia (ISA), a notifiable disease affecting Atlantic salmon and resulting in high mortality ([Weli, S.C., et al. 2013](#)). ISAV is similar in structure to other orthomyxoviruses, with the exception of the hemagglutinin (HA) protein that would appear to be significantly different in size than for other influenza type viruses ([Rimstad, E., et al. 2001](#))

ISAV was first identified in farmed salmon in Norway in 1984, spread by wild marine fish species, it has since been detected in farmed Atlantic salmon stocks throughout the North Atlantic, North West America and more recently in Chile, where it has also been detected in farmed Coho salmon ([Godoy, M.G., et al. 2008](#)). Due to the high mortality of infected individuals, ISAV has a significant economic impact and infections are of serious concern to the aquaculture industry.

While the route of entry into the host, is as yet, poorly understood, evidence indicates that the virus enters through epithelial tissue in the gills ([Weli, S.C., et al. 2013](#)), this is similar to mammalian orthomyxoviruses which target respiratory tissues.

Clone 4A11 can be used to identify ISAV in the tissues of infected fish and may be of use for research into methods for diagnosis and control of ISAV infections in the aquaculture industry.

**Storage** Store at +4°C or at -20°C if preferred.

This product should be stored undiluted.

Storage in frost-free freezers is not recommended. Avoid repeated freezing and thawing as this may denature the antibody. Should this product contain a precipitate we recommend microcentrifugation before use.

<b>Guarantee</b>	18 months from date of despatch.
