<b>Specificity</b>	<p><b>Mouse anti Human CD3 antibody, clone OKT3</b>, recognizes T-cell surface glycoprotein CD3 epsilon chain (CD3ε), also known as T-cell surface antigen T3/Leu-4 epsilon. CD3ε is a subunit within the multiprotein cell surface receptor TCR-CD3 complex, which is expressed on the surface of mature T cells, NKT cells and thymocytes (<a href="#">Mariuzza et al. 2020</a>). The CD3 complex is required for intracellular signaling and for TCR surface expression. Recruitment of the TCR/CD3 complex initiates early events leading to proliferation and differentiation of mature T cells into an effector cell (<a href="#">Guy &amp; Vignali 2009</a>).</p> <p>Mice that lack the CD3ε gene exhibit early arrest in T cell development and mutation of the gene in humans has been seen to result in severe combined immunodeficiency (SCID) (<a href="#">DeJarnette et al. 1998</a>, <a href="#">de Saint Basile et al. 2004</a>).</p> <p>Mouse anti Human CD3, clone OKT3 is commonly used in flow cytometry in the phenotyping human T cells. Characterization of the OKT3 clone has shown that it is able to compete and block the binding of the CD3 clones SK7 and UCHT1 to human T cells (<a href="#">Li et al. 2005</a>). The OKT3 clone has also been found to have immunosuppressive properties in vivo. As result of this, the clone was humanized to be used as a therapeutic drug called Muromonomab (Orthoclone). Muromonomab was used as an immunosuppressive including for after solid organ transplants, to prevent the activation of CD4- and CD8- T cells (<a href="#">Wilde &amp; Goa 1996</a>). However, the drug has since been discontinued due to the development of other treatments with similar efficacy and fewer side effects (<a href="#">Reichert 2012</a>).</p>
