**Specificity**

**Mouse anti Human LMAN1 antibody** recognizes LMAN1, also known as ER-Golgi intermediate compartment 53 kDa protein, endoplasmic reticulum-golgi intermediate compartment protein 53, intracellular mannose specific lectin, intracellular mannose-specific lectin MR60 and protein ERGIC-53.

Encoded by the LMAN1 gene, this protein is a type I integral membrane protein localized in the intermediate region between the endoplasmic reticulum and the Golgi, presumably recycling between the two compartments. It is a mannose-specific lectin and is a member of a novel family of plant lectin homologs in the secretory pathway of animal cells. Mutations in the LMAN1 gene are associated with a coagulation defect. Using positional cloning, the gene was identified as the disease gene leading to combined factor V-factor VIII deficiency, a rare, autosomal recessive disorder in which both coagulation factors V and VIII are diminished (provided by RefSeq, Jul 2008).

Mouse anti Human LMAN1 antibody detects a band of 54 kDa. The antibody has been extensively validated for western blotting using whole cell lysates.
