Specificity

Mouse anti Human CD36 antibody recognizes CD36, also known as CD36 antigen (collagen type I receptor, thrombospondin receptor), GPIIIB, PAS IV, PAS-4 protein, cluster determinant 36, fatty acid translocase, glycoprotein IIIb, leukocyte differentiation antigen CD36, platelet glycoprotein 4, platelet glycoprotein IV and scavenger receptor class B, member 3.

The protein encoded by the CD36 gene is the fourth major glycoprotein of the platelet surface and serves as a receptor for thrombospondin in platelets and various cell lines. Since thrombospondins are widely distributed proteins involved in a variety of adhesive processes, this protein may have important functions as a cell adhesion molecule. It binds to collagen, thrombospondin, anionic phospholipids and oxidized LDL. It directly mediates cytoadherence of *Plasmodium falciparum* parasitized erythrocytes and it binds long chain fatty acids and may function in the transport and/or as a regulator of fatty acid transport. Mutations in CD36 cause platelet glycoprotein deficiency. Multiple alternatively spliced transcript variants encoding the same protein have been found for CD36 (provided by RefSeq, Jul 2008).

Mouse anti Human CD36 antibody detects a band of 86 kDa. The antibody has been extensively validated for western blotting using whole cell lysates.

Western Blotting

Anti CD36 detects a band of approximately 86 kDa in U-937 cell lysates.
