<b>Specificity</b>	<p><b>Mouse anti Human hnRNP M antibody</b> recognizes heterogeneous nuclear ribonucleoprotein M (hnRNP M), also known as CEA receptor, N-acetylglucosamine receptor 1, heterogenous nuclear ribonucleoprotein M4 and hnRNA-binding protein M4.</p> <p>Encoded by the HNRNPM gene, hnRNP M belongs to the subfamily of ubiquitously expressed heterogeneous nuclear ribonucleoproteins (hnRNPs). The hnRNPs are RNA binding proteins and they complex with heterogeneous nuclear RNA (hnRNA). These proteins are associated with pre-mRNAs in the nucleus and appear to influence pre-mRNA processing and other aspects of mRNA metabolism and transport. While all of the hnRNPs are present in the nucleus, some seem to shuttle between the nucleus and the cytoplasm. The hnRNP proteins have distinct nucleic acid binding properties. Heterogeneous nuclear ribonucleoprotein M has three repeats of quasi-RRM domains that bind to RNAs. This protein also constitutes a monomer of the N-acetylglucosamine-specific receptor which is postulated to trigger selective recycling of immature GlcNAc-bearing thyroglobulin molecules. Alternative splicing results in multiple transcript variants (provided by RefSeq, Aug 2011).</p> <p>Mouse anti Human hnRNP M antibody detects a band of 77 kDa. The antibody has been extensively validated for western blotting using whole cell lysates.</p>
<b>Western Blotting</b>	Anti hnRNP M detects a band of approximately 77 kDa in MOLT-4 cell lysates
