Encoded by the ERAB / HSD17B10 gene, 3-hydroxyacyl-CoA dehydrogenase type-2 is a member of the short-chain dehydrogenase/reductase superfamily. 3-hydroxyacyl-CoA dehydrogenase type-2 is mitochondrial protein that catalyzes the oxidation of a wide variety of fatty acids, alcohols, and steroids and has been implicated in the development of Alzheimer's disease. Mutations in the gene are the cause of 2-methyl-3-hydroxybutyryl-CoA dehydrogenase deficiency (MHBDD). Several alternatively spliced transcript variants have been identified, but the full-length nature of only two transcript variants has been determined (provided by RefSeq, Jul 2008).

Mouse anti Human ERAB antibody detects a band of 27 kDa. The antibody has been extensively validated for western blotting using whole cell lysates.
