**Specificity**

**Mouse anti SNW1 antibody** recognizes SNW domain-containing protein 1, also known as SKIIP, SKIP. SNW1 is a multifunctional protein which can act by direct protein interactions, by regulation of mRNA splicing, or regulation of transcription ([Hoflmayer et al. 2019](#)). To regulate mRNA splicing, SNW1 forms a component of the spliceosome which removes intronic sequences from pre-mRNAs before export of mature mRNA from the nucleus ([van der Lelij et al. 2014](#)). SNW1 is recruited to pre-mRNA after U1 and U4 snRNPs dissociate from the spliceosome. To regulate transcription, SNW1 is able to associate with numerous transcription factors to modulate their activities ([Sato et al. 2015](#)). SNW1 overexpression has been associated with poor prognosis in a variety of cancer types, and is upregulated in types of breast cancer, liver cancer, bladder cancer and malignant pleural mesothelioma ([Hoflmayer et al. 2019](#)). In embryogenesis, SNW1 is essential for defining the edge of the neural plate where the neural crest is specified ([Wu et al. 2011](#)).
